

## 71-101 ATPase Reagent

A reagent for degrading e.g. non-bacterial ATP in biological samples containing extracellular ATP.

Delivery form: Lyophilised under argon

Reconstitution: In 26-101 ATPase Diluent (11,2 mL)

Number of assays: Around 110 incubations with 0.1 mL reagent and 0.1 mL sample

Activity:  $t_{1/2}$  of extracellular ATP is approx. 2 seconds when reagent is diluted with an equal volume of non-inhibitory sample.

Storage: -18 °C or lower.

Transportation: The product does not need to be transported at low temperature. The activity of the lyophilised product is not affected by a week at room temperature.
